

SLaiDES example PDF page counts & repetition review

Why many example PDFs have more than one page

The PDF builder emits one PDF page per resolved slide. Most numbered component examples are two-slide decks: a cover title-slide followed by the actual component specimen. Therefore most PDFs are two pages even though they demonstrate one component.

PDF group	Pages	Reason
01_title_slide.pdf	1	The title slide is the example itself.
02–08 and 11–42 numbered examples	2	Cover title-slide + one component specimen.
09_full_deck.pdf / demo-5.pdf	5	Mini showcase decks with multiple components.
10_all_components.pdf	8	Broad component sampler.
agents-in-ai.pdf	10	Narrative deck, not a single-component specimen.

Excessive repetition patterns

- Cover-page repetition: 41 of 42 numbered component examples begin with a title-slide cover, so most files repeat the same first-page pattern.
- Same scaffold: theme settings, page numbers, title slide, component slide.
- Same centered title/subtitle hierarchy and recurring page-number chrome.
- Repeated grid/list/card vocabulary across item-heavy components.
- Full-deck examples reuse opener/closer framing and similar palette-driven accents.

Three alternatives for less repetitive review artifacts

Alternative	What to create	Why it helps
1. One-page component specimens	Each component PDF contains only the component slide, with an eye-catching label on the component.	Matches the “one PDF per component page” expectation and removes redundancy.
2. Contact-sheet catalog	A review PDF with 6–9 miniature component specimens per page.	Makes duplicate structure obvious and speeds library review.
3. Variant triptych	For repetitive components, show baseline, editorial/large-type, and dismissal state designs while keeping	Dismissal state design variants while keeping the same schema and content.

Suggested next action: decide whether examples/pdf should be a developer test fixture (keep covers for traceability) or a public component gallery (prefer one-page specimens or a contact sheet).
