

# AeSlides: Incentivizing Aesthetic Layout in LLM-Based Slide Generation via Verifiable Rewards

**Year:** 2026      **Source:** docs/REFERENCES.md verified bibliography

|                          |                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Question                 | One-page summary                                                                                                                                                                                             |
| What it studies          | Verifiable rewards for LLM slide generation; measures aspect ratio, whitespace, collisions, and imbalance over rendered pixels.                                                                              |
| What slidekit uses       | Direct analogue for slidekit whitespace, non-overlap, and balance, but slidekit computes over native geometry instead of screenshots.                                                                        |
| YAML vs HTML implication | HTML/render-first research is closer to what users see, but depends on browser/rendering stacks and formula opacity. YAML/source-first is deterministic and auditable, but must approximate pixel-only cues. |
| Executive takeaway       | Use research-style HTML/rendered evaluation when pixel fidelity is the object of study; use slidekit YAML when the production goal is auditable, schema-valid, deterministic deck generation.                |
