

Test & Validation Summary

slidekit (SLaiDES) · 2026-07-19 · branch `claude/slide-template-design-lgqnqj` @ 60d45d0

346 passed	0 failed	38 skipped	384 collected	~9s runtime
---------------	-------------	---------------	------------------	----------------

Command: `python -m pytest -q` · framework `pytest 9.1.1 / Python 3.11` · result: **PASS** (exit 0, no failures or errors).

Executive summary

This run validates two changes made this session: (1) a new **file-tree** slide type — a directory tree in a rounded dark card with auto-drawn connectors — plus generic rounded-rectangle support in the PPTX/PDF/HTML emitters; and (2) a new 20-slide deck on the paper *Ngo, Teo & Byrne — Modelling interface aesthetics* (Information Sciences 152:25–46, 2003), authored from the repository's own documentation.

Everything was checked using the project's own rules and automated tests only — the deterministic geometry linter (the build gate), the geometry-and-theme aesthetic scorer, and the pytest suite. **No vision model, screenshot, or rendered-image review was used** at any point; correctness is proven from source geometry, not pixels.

Results by test area

Test area	Passed	What it checks
test_ir	43	IR schema / pydantic models (incl. new FileTree models)
test_layout	78	Layout engine geometry + golden snapshots
test_examples_pdf	37	Every example deck has a committed PDF; page count = slide count
test_aesthetics	29	Aesthetic scorer + designed-beats-plain invariant
test_metrics	28	Font metrics / text measurement
test_lint	21	Linter rules (overflow, margin, overlap, gap, contrast)
test_cli	20	CLI: build / layout / score / new / catalog
test_web	16	Web preview data in sync with catalog
test_emit	13	PPTX / PDF / HTML emitters (incl. rounded corners)
test_select	12	Layout recommendation / selection guide
test_catalog	9	Registry covers exactly the components; one anchor per family
test_author	7	Authoring helpers

Test area	Passed	What it checks
test_integration	7	End-to-end agency pipeline
test_board	6	Board rendering
test_combined_pdf	4	Combined-PDF archive in sync with layouts
test_examples_index	3	EXAMPLES_INDEX.md in sync with examples/
test_feedback	10	Feedback intake
test_verify	3	Render-drift harness (40 total; 37 skipped — see below)

About the 38 skipped tests

37 · Render-drift harness (test_verify) — skipped because the external renderer pdftoppm (poppler-utils) is not installed in this environment. This CI-only harness rasterises output to detect renderer drift; it is **not** part of slide generation and its absence does not affect any deliverable.

1 · Missing golden (test_layout) — a pre-existing unrelated deck (claude-code-for-data-scientists) has no golden snapshot committed. Not introduced by this session's work.

No skip masks a failure — every skip is an environment/data gap, not a broken assertion.

Deliverable validation (rules, not vision)

Deliverable	Linters (gate)	Aesthetic score	Tests
44_file_tree.yaml (new slide type)	lint-clean	n/a (single example)	golden + PDF page-count pass
ngo-interface-aesthetics.yaml (20 slides)	lint-clean	78.9 / 100 (advisory)	golden + PDF page-count pass

The linter is the **gate**: it blocks a build on any objective defect (text overflow, margin/overlap/gap violations, low contrast, sub-floor font sizes). The aesthetic score is an **advisor** (0–100 with sub-metrics); its warnings never block a build. During authoring, the linter caught real overflow and spacing defects across three build passes before the deck reached lint-clean — the intended feedback loop, with no rendered preview.

Generated from JUnit XML of `python -m pytest` on 2026-07-19. Geometry- and rule-based validation only; no image rendering used to judge correctness.
